Milestone 2 Narrative

The artifact I have chosen is the inventory app I made using android studio for CS-360: mobile architecture and programming. This android application allows users to log in to the application using a username and password, which brings them to a screen to track inventory items. Users can add, delete, and change items as they see fit, with notifications sent to their phone when inventory is low. This application was finalized in October of 2025.

I have chosen this artifact to enhance as, firstly, it is the project I made that I was most proud of because of its demonstration of a variety of skills. I also picked this artifact because it showcases my skills in making android applications, which aligns with the career path I am moving towards, that being mobile application development, and it aligns with my current job, this application being something that could enhance our current inventory management. The specific components that showcase my skills in software development are the structure of the application, UI and UI flow, Recycler View which updates automatically when inventory is updated, and use of SQL queries. The artifact was improved by adding a barcode scanner functionality for an easier way to add items, and a restructure of the code for separation of concern.

The course outcome I planned to meet in Module One was to demonstrate an ability to use well-founded and innovative techniques, skills, and tools in computing practices for the purpose of implementing computer solutions that deliver value and accomplish industry-specific

goals. I believe I achieved this goal, as my scanner functionality accomplishes industry-specific goals, that being the grocery or retail industry. The scanner function makes it easier for warehouse workers to add items into inventory through a quick scan.

Upon enhancing and modifying this artifact, I have learned a lot. Firstly, I learned how important separation of concerns is firsthand, as it made it a lot easier to implement the barcode scanner functionality. Secondly, I had no prior knowledge of how barcode scanners worked or what they output, so that was something I learned although it was simpler than I thought it might be. I had some challenges with changing the code base to work with a unique UPC instead of what it was before, that being an integer that auto incremented, but a few failed runs and some bug fixes later, I was able to get everything to work properly.
